

Cascade v23 — parameter INTERACTIONS (valence × anion on stability & oxidation)

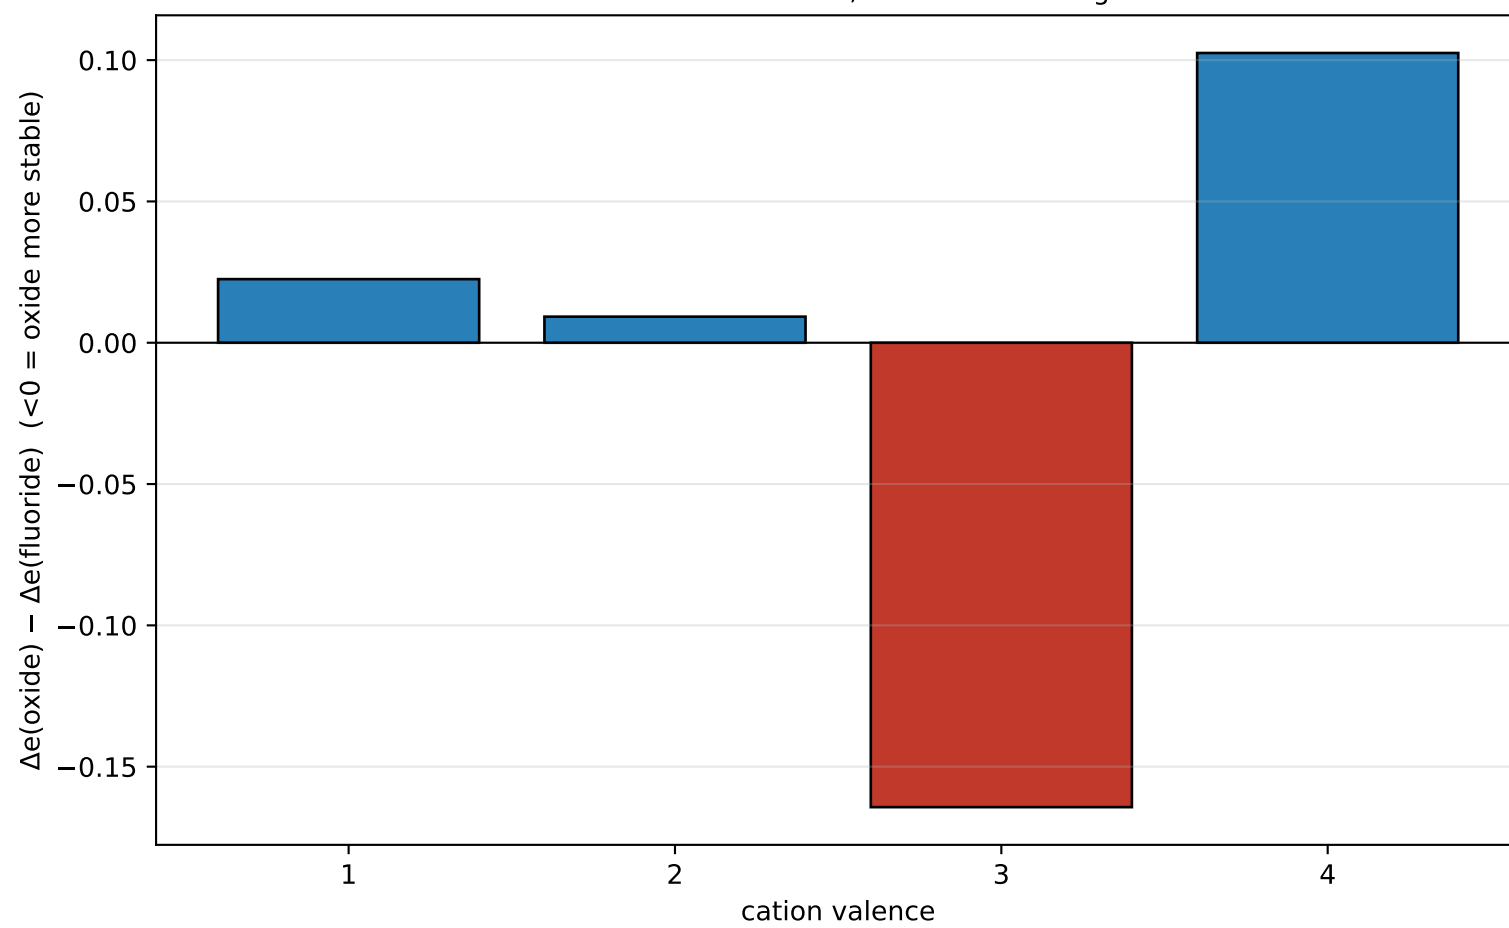

(A) INTERACTION valence×anion → stability
lines diverge at val 3 (oxide pulls ahead) = interaction

(B) INTERACTION valence×anion → oxidation onset

(C) Anion effect is NOT constant across valence = the interaction
val 3: oxide much more stable; val 4: fluoride edges ahead

(D) Regression w/ interaction term (* = $|t| > 2$)
valence:isF = interaction strength
