

(A) Stability ranking —  $\text{Gd}_2\text{O}_3/\text{Ta}_2\text{O}_5/\text{Nb}_2\text{O}_5$  lead; alkali/late-TM oxides weakest

(B) Coating map: stable + soft = lower-left = best candidate

(C) Stability vs valence — higher charge cation stabilizes more

(D)  $B_0$  vs  $E_{\text{young}}$  — red ring = elastic outlier, red x = EOS-fit fail
